One percent of the total of what we invest in fighting poverty and extreme hunger is really hard to define to people but totally in keeping with the best values not only of the country but of what we do to change people's opinions, to change lives, to open up opportunity as a consequence of that. When others prosper, we prosper as well. As we've seen with the use of agricultural science and technology, when we have investments in agriculture and nutrition mean that healthier harvests and higher incomes lead to security, stability, and economic growth. Security efforts generate economic growth and global stability, which ultimately benefits us all and creates a secure world. By helping reduce global poverty and the scourge of extreme poverty, we are advancing this critical agenda through our signature global hunger and food security initiative, Feed the Future. And Feed the Future is showing results. We have made a great deal of progress already. But we know above all that the enormous array of the opportunities and challenges that we face requires huge investments in the future, but also, immediately, short-term, protracted conditions that make a country dangerous or unstable, which is why we need to tackle this challenge head on, as he said, for the sake of the world's challenges that we face requires huge investments in the future, but also, immediately, short-term, protracted conditions that make a country dangerous or unstable, which is why we need to tackle this challenge head on, as he said, for the sake of safety and prosperity for all. Let me just outline a few of my chief concerns that we discussed together and which I think the world heard. He has urged all of us to issue a call to deal with climate change. And it was a passionate about, and that's the subject that President Obama laid to the United States Agency for International Development (USAID) Headquarters, from February 15, 2013, from Secretary of State John Kerry's.
